You are given an array A of N integers. An equilibrium position is a position where the sum of all integers on its left is equal to the

Note: For any given array there is only a single equilibrium position, if no equilibrium position is found then print "NOT FOUND"

The array is 1 indexed.

Input Format:

The input consists of two lines:

The first line contains an integer denoting N.

The second line contains N space-separated integers denoting the elements of the array A.

Input will be read from the STDIN by the candidate

Output Format:

Print the index of the equilibrium position. If no index is found, print "NOT FOUND"

Sample Input

24733

Sample Output

TIBS

Source Code:

```
n=int(input())
l=list(map(int,input().split()))
f=0

for i in range(n):
    s1=sum(1[:i])
    s2=sum(1[i+1:])
    if s1==s2:
        print(i+1)
        f=1
        break
    if f==0:
        print("NOT FOUND")
